II. The derivated parameters and the functions required

II.1. The derivated parameters

$$\text{The cell area } Sa = \frac{3\sqrt{3} aCC^2}{4} = 0.0261938 \text{ nm}^2$$

II.2. The required functions-----

II.2.1. The function fSpiraleLen[2, φ In, φ Out, h] defines

the Length of a Spirale with the inner angle φ In and the outer angle φ Out ($\geq \varphi$ In):

$$fSpiraleLen[2, \varphi In, \varphi Out, h] = \frac{h \left(-\varphi In \sqrt{1 + \varphi In^2} + \varphi Out \sqrt{1 + \varphi Out^2} - \text{ArcSinh}[\varphi In] + \text{ArcSinh}[\varphi Out] \right)}{2 \pi}.$$

II.2.2. The function fElast[φ In, ρ Out] is required to calculate an nanoscroll elastic energy:

$$fElast[\varphi In, \varphi Out] = \frac{\sqrt{1 + \varphi In^2}}{\varphi In} - \frac{\sqrt{1 + \varphi Out^2}}{\varphi Out} - \text{ArcSinh}[\varphi In] + \text{ArcSinh}[\varphi Out].$$

II.2.3. Define the function fPhiOutvsPhiInLh[2, φ In, L, h].

The function fPhiOutvsPhiInLh[2, φ In, L, h] = $\sqrt{\frac{2 L \pi}{h} + \varphi In^2}$ is a good approximation to obtain the value of φ Out for the defined φ In, L, h.

The inverse function fPhiInvsPhiOutLh[2, φ Out, L, h] = $\sqrt{-\frac{2 L \pi}{h} + \varphi Out^2}$

could be used in the program applications

if ROut (instead of RIn) is the input parameter of the system.

II.2.4. The functions fSpirale1Under(Over)Spirale1Length[NoLv, PhiInlv, PhiOutlv, hv]

These functiona are not required, dut could be helpful),

$$fSpirale1UnderSpirale2Length[1, \text{PhiInlv}, \text{PhiOutlv}, hv, d\text{Phi}2v] =$$

$$fSpiraleLen[\text{NoLv}, \text{PhiInlv}, \text{PhiOutlv} - 2 \pi / \text{NoLv}, hv] = \frac{1}{4 \pi}$$

$$fSpirale1UnderSpirale2Length[\text{NoLp}, \text{PhiInlp}, \text{PhiOutlp}, hp, d\text{Phi}2p] = fSpirale1UnderSpirale2Length[2, \frac{\text{PhiInlp}}{2 \pi} (2 \pi), \frac{\text{PhiOutlp}}{2 \pi} (2 \pi), 0.3354 \text{ nm}, 0. (2 \pi)] =$$

$$\text{fRIn1Sharp}[\text{NoLv}, \text{Llv}, \text{hv}] = -\frac{\text{hv NoLv}}{2} + \frac{\text{Llv}}{2 \pi}$$
